			MAIL DATE 09/27/2007	DELIVERY MODE PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/773,423	Applicant(s) FURUYA, TOMOYUKI	
	Examiner Marcus T. Riley	Art Unit 2625	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 2/9/04.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-14 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-14 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on _____ is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. **Claims 1-3, 6-9 & 12-14** are rejected under 35 U.S.C. 103(a) as being unpatentable over Ohnishi '465 (US 7,853,465 B1 hereinafter, Ohnishi '465) in combination with Shimzu (US 6,490,055 hereinafter, Shimzu '055).

Regarding claim 1; Ohnishi '465 discloses a printing control apparatus for outputting print data and executing printing, comprising: storage means, to which rendering instructions are input, for storing the rendering instructions page by page (*"FIG. 2 is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a medium reading unit, is read by a central processing unit and a print command is input by an input unit for the transmission of data to a printer;"* column 2, lines 14-19); a first rendering means for developing rendering instructions applicable to each line into multi-valued bitmap data and subjecting the multi-valued bitmap data to color processing and n-value conversion processing (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-*

Art Unit: 2625

valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map." column 4, lines 15-22); a second rendering means for subjecting the rendering instructions to color processing and n-value conversion processing color by color of the rendering instructions, storing the results in the form of an n-valued pattern, and pasting the n-valued pattern in an applicable area of the rendering instructions to thereby achieve development into n-valued bitmap data ("*...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map.*" column 4, lines 15-22); a determining means for reading out rendering instructions that have been stored in said storage means and determining whether the rendering instructions include a rendering instruction that cannot be implemented by overwrite ("*FIG. 2 is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a medium reading unit, is read by a central processing unit and a print command is input by an input unit for the transmission of data to a printer;*" column 2, lines 14-19).

Ohnishi '465 does not expressly disclose control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second

Art Unit: 2625

rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite

Shimizu '055 discloses control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite (*"...and control means for controlling the band rendering to be executed without lowering the color gradation when the banding process is judged to be executable by said judgment means, or the degrade rendering to be executed by lowering the color gradation when the banding process is judged to be inexecutable."* column 3, lines 10-15).

Ohnishi '465 and Shimzu '055 are combinable because they are from same field of endeavor of a printing apparatus (*"The present invention relates to a color printing apparatus..."* Shimzu '055 at column 1, lines 10).

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to modify the printing apparatus as taught by Ohnishi '465 by adding control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite as taught by Shimzu '055.

The motivation for doing so would have been because it advantageous to provide a color printing apparatus at a lower cost and with a certain precision (*"...it is an object of the present invention to provide a color printing apparatus which can realize a color logical drawing at lower cost and with a certain precision."* Shimzu '055 at column 2, lines 28-31).

Therefore, it would have been obvious to combine Ohnishi '465 with Shimzu '055 to obtain the invention as specified in claim 1.

Regarding claim 2; Ohnishi '465 discloses where said first rendering means includes: means for generating multi-valued bitmap data based upon the rendering instructions; first color correcting means for performing a color correction of the multi-valued bitmap data; first color converting means for converting colors of the multi-valued bitmap data that has been subjected to the color correction by said first color correcting means to multi-valued bitmap data of another color space; and n-value converting means for subjecting the multi-valued bitmap data that has been subjected to the color conversion by said first color converting means to an n-value conversion (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map."* column 4, lines 15-22).

Regarding claim 3; Ohnishi '465 discloses where said second rendering means includes: second color correcting means for correcting colors of an image included in the rendering instructions; second color converting means for converting colors of the image that has been

Art Unit: 2625

subjected to the color correction by said second color correcting means to colors of another color space; image n-value converting means for subjecting the image data of the image that has been subjected to the color conversion by said second color converting means to an n-value conversion and creating an n-valued pattern; and means for creating n-valued bitmap data based upon the n-valued pattern obtained by the n-value conversion performed by said image n-value converting means (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map."* column 4, lines 15-22).

Regarding claim 6; Ohnishi '465 discloses where the value of n is 2 (*"In the optimal color process for each object, for example, a coefficient for color conversion, and the size of a dither matrix for binarization and a threshold value are consonant with the attribute of an object. The size of an n-valued dither matrix, a threshold value and the number of sheets may be consonant with the attribute of an object."* column 7, lines 27-32).

Regarding claim 7; Ohnishi '465 discloses a printing control method for outputting print data and executing printing, comprising: a storage step of inputting rendering instructions and storing the rendering instructions in a memory page by page (*"FIG. 2 is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a medium reading unit, is read by a central processing unit and a print command is input by an input unit for the transmission of*

Art Unit: 2625

data to a printer;" column 2, lines 14-19); a first rendering step of developing rendering instructions applicable to each line into multi-valued bitmap data and subjecting the multi-valued bitmap data to color processing and n-value conversion processing (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map."* column 4, lines 15-22); a second rendering step of subjecting the rendering instructions to color processing and n-value conversion processing color by color of the rendering instructions, storing the results in the form of an n-valued pattern, and pasting the n-valued pattern in an applicable area of the rendering instructions to thereby achieve development into n-valued bitmap data (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map."* column 4, lines 15-22); a determining step of determining whether rendering instructions that have been read out of the memory include a rendering instruction that cannot be implemented by overwrite (*"FIG. 2 is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a*

Art Unit: 2625

medium reading unit, is read by a central processing unit and a print command is input by an input unit for the transmission of data to a printer;" column 2, lines 14-19).

Ohnishi '465 does not expressly disclose control step of exercising control so as to use said first rendering step if it is determined at said determining step that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering step if it is determined at said determining step that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite.

Shimizu '055 discloses a control step of exercising control so as to use said first rendering step if it is determined at said determining step that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering step if it is determined at said determining step that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite (*"and control means for controlling the band rendering to be executed without lowering the color gradation when the banding process is judged to be executable by said judgement means, or the degrade rendering to be executed by lowering the color gradation when the banding process is judged to be inexecutable."* column 3, lines 10-15).

Ohnishi '465 and Shimzu '055 are combinable because they are from same field of endeavor of a printing apparatus (*"The present invention relates to a color printing apparatus..."* Shimzu '055 at column 1, lines 10).

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to modify the printing apparatus as taught by Ohnishi '465 by adding a control step of exercising control so as to use said first rendering step if it is determined at said determining step

Art Unit: 2625

that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering step if it is determined at said determining step that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite as taught by Shimzu '055.

The motivation for doing so would have been because it advantageous to provide a color printing apparatus at a lower cost and with a certain precision (*"...it is an object of the present invention to provide a color printing apparatus which can realize a color logical drawing at lower cost and with a certain precision."* Shimzu '055 at column 2, lines 28-31).

Therefore, it would have been obvious to combine Ohnishi '465 with Shimzu '055 to obtain the invention as specified in claim 1.

Regarding claim 8; Ohnishi '465 discloses where said first rendering step includes: a step of generating multi-valued bitmap data based upon the rendering instructions; a first color correcting step of performing a color correction of the multi-valued bitmap data; a first color converting step of converting colors of the multi-valued bitmap data that has been subjected to the color correction at said first color correcting step to multi-valued bitmap data of another color space; and an n-value converting step of subjecting the multi-valued bitmap data that has been subjected to the color conversion at said first color converting step to an n-value conversion (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color*

Art Unit: 2625

correction may be performed either before or after the color data have been used to generate the bit map." column 4, lines 15-22).

Regarding claim 9; Ohnishi '465 discloses where said second rendering step includes: a second color correcting step of correcting colors of an image included in the rendering instructions; a second color converting step of converting colors of the image that has been subjected to the color correction at said second color correcting step to colors of another color space; an image n-value converting step of subjecting the image data of the image that has been subjected to the color conversion at said second color converting step to an n-value conversion and creating an n-valued pattern; and a step of creating n-valued bitmap data based upon the n-valued pattern obtained by the n-value conversion performed at said image n-value converting step ("*...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map.*" column 4, lines 15-22).

Regarding claim 12; Ohnishi '465 discloses a printer driver for receiving rendering instructions from an application, creating print data and outputting the print data to a printing apparatus, comprising: storage means, to which rendering instructions are input from the application, for storing the rendering instructions in a memory page by page ("*FIG. 2 is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a medium reading unit,*

Art Unit: 2625

is read by a central processing unit and a print command is input by an input unit for the transmission of data to a printer;" column 2, lines 14-19); a first rendering means for expanding rendering instructions applicable to each line, which rendering instructions have been stored in the memory, into multi-valued bitmap data and subjecting the multi-valued bitmap data to color processing and n-value conversion processing ("*...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map.*" column 4, lines 15-22); a second rendering means for subjecting the rendering instructions that have been stored in the memory to color processing and n-value conversion processing color by color of the rendering instructions, storing the results in the form of an n-valued pattern, and pasting the n-valued pattern in an applicable area of the rendering instructions to thereby achieve development into n-valued bitmap data ("*...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map.*" column 4, lines 15-22); a determining means for reading out rendering instructions that have been stored in the memory and determining whether the rendering instructions include a rendering instruction that cannot be implemented by overwrite; ("*FIG. 2*

Art Unit: 2625

is a conceptual diagram showing a process during which data, which is associated with an image processing control program and which is stored in the storage device of a medium reading unit, is read by a central processing unit and a print command is input by an input unit for the transmission of data to a printer;" column 2, lines 14-19).

Ohnishi '465 does not expressly disclose control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite.

Shimizu '055 discloses control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite (*"and control means for controlling the band rendering to be executed without lowering the color gradation when the banding process is judged to be executable by said judgment means, or the degrade rendering to be executed by lowering the color gradation when the banding process is judged to be inexecutable."* column 3, lines 10-15).

Ohnishi '465 and Shimzu '055 are combinable because they are from same field of endeavor of a printing apparatus (*"The present invention relates to a color printing apparatus..."* Shimzu '055 at column 1, lines 10).

Art Unit: 2625

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to modify the printing apparatus as taught by Ohnishi '465 by adding control means for exercising control so as to use said first rendering means if said determining means determines that the rendering instructions include a rendering instruction that cannot be implemented by overwrite, and use said second rendering means if said determining means determines that the rendering instructions do not include a rendering instruction that cannot be implemented by overwrite as taught by Shimzu '055.

The motivation for doing so would have been because it advantageous to provide a color printing apparatus at a lower cost and with a certain precision (*"...it is an object of the present invention to provide a color printing apparatus which can realize a color logical drawing at lower cost and with a certain precision."* Shimzu '055 at column 2, lines 28-31).

Therefore, it would have been obvious to combine Ohnishi '465 with Shimzu '055 to obtain the invention as specified in claim 1.

Regarding claim 13; Ohnishi '465 discloses where said first rendering means includes: means for generating multi-valued bitmap data based upon the rendering instructions; first color correcting means for performing a color correction of the multi-valued bitmap data; first color converting means for converting colors of the multi-valued bitmap data that has been subjected to the color correction by said first color correcting means to multi-valued bitmap data of another color space; and n-value converting means for subjecting the multi-valued bitmap data that has been subjected to the color conversion by said first color converting means to an n-value conversion (*"...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the*

Art Unit: 2625

resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map." column 4, lines 15-22).

Regarding claim 14; Ohnishi '465 discloses a where said second rendering means includes: second color correcting means for correcting colors of an image included in the rendering instructions; second color converting means for converting colors of the image that has been subjected to the color correction by said second color correcting means to colors of another color space; image n-value converting means for subjecting the image data of the image that has been subjected to the color conversion by said second color converting means to an n-value conversion and creating an n-valued pattern; and means for creating n-valued bitmap data based upon the n-valued pattern obtained by the n-value conversion performed by said image n-value converting means ("*...while referring to the pattern plane, color conversion, which is consonant with the attribute of an object, is performed for the obtained multi-value bit map, and the resultant bit map is binarized (n-valued) to obtain a device bit map. When the processing has been completed for the overall image, the device bit map is transmitted to the printer. Color correction may be performed either before or after the color data have been used to generate the bit map.*" column 4, lines 15-22).

3. **Claims 4, 5, 10 & 11** are rejected under 35 U.S.C. 103(a) as being unpatentable over Ohnishi '465 in combination with Shimzu '055.

Art Unit: 2625

Regarding claim 4; Ohnishi '465 as modified does not expressly disclose where said storage means sorts and stores entered rendering instructions, and said first and second rendering means read out and process the rendering instructions in the order in which they have been sorted and stored in said storage means.

Shimzu '055 discloses where said storage means sorts and stores entered rendering instructions, and said first and second rendering means read out and process the rendering instructions in the order in which they have been sorted and stored in said storage means (*"Each mask object finally created is made by subdividing a page memory for the rendering with smaller memory capacity than the full page memory, i.e., banding, into multiple bands (desirably a power of 2 in height, and optimally about 512 dots), sorting each mask object for each band, and making up a link list as shown in FIG. 5D within each band."* column 6, lines 38-44).

Ohnishi '465 and Shimzu '055 are combinable because they are from same field of endeavor of a printing apparatus (*"The present invention relates to a color printing apparatus..."* Shimzu '055 at column 1, lines 10).

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to modify the printing apparatus as taught by Ohnishi '465 by adding where said storage means sorts and stores entered rendering instructions, and said first and second rendering means read out and process the rendering instructions in the order in which they have been sorted and stored in said storage means as taught by Shimzu '055.

The motivation for doing so would have been because it advantageous to provide a color printing apparatus at a lower cost and with a certain precision (*"...it is an object of the present*

Art Unit: 2625

invention to provide a color printing apparatus which can realize a color logical drawing at lower cost and with a certain precision." Shimzu '055 at column 2, lines 28-31).

Therefore, it would have been obvious to combine Ohnishi '465 with Shimzu '055 to obtain the invention as specified in claim 1.

Regarding claim 5; Shimzu '055 discloses where the sorting order is in a direction from the top to the bottom of a page (*"Each mask object finally created is made by subdividing a page memory for the rendering with smaller memory capacity than the full page memory, i.e., banding, into multiple bands (desirably a power of 2 in height, and optimally about 512 dots), sorting each mask object for each band, and making up a link list as shown in FIG. 5D within each band."* column 6, lines 38-44).

Regarding claim 10; Shimzu '055 discloses where inputted rendering instructed are sorted and stored in the memory at said storage step, and the rendering instructions are read out and processed in said first and second rendering steps in the order in which they have been sorted and stored in the memory. (*"Each mask object finally created is made by subdividing a page memory for the rendering with smaller memory capacity than the full page memory, i.e., banding, into multiple bands (desirably a power of 2 in height, and optimally about 512 dots), sorting each mask object for each band, and making up a link list as shown in FIG. 5D within each band."* column 6, lines 38-44).

Regarding claim 11; Shimzu '055 discloses where the sorting order is in a direction from the top to the bottom of a page. (*"Each mask object finally created is made by subdividing a page memory for the rendering with smaller memory capacity than the full page memory, i.e., banding, into multiple bands (desirably a power of 2 in height, and optimally about 512 dots),*

Art Unit: 2625

sorting each mask object for each band, and making up a link list as shown in FIG. 5D within each band." column 6, lines 38-44).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Marcus T. Riley whose telephone number is 571-270-1581. The examiner can normally be reached on Monday - Friday, 7:30-5:00, est.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Twyler Lamb can be reached on 571-272-7406. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
